

ABSTRACT

A display system provided with transportability and being accessible from a mobile information terminal, a wireless communication network connects between a server 101 and a display device 102 and between the display device 102 and other display devices in tandem. Each display device has an interface for connecting with a mobile information terminal. The communication interface between each display device and the server or another display device uses one protocol for larger-capacity communication at a higher frequency band than that for the wireless communication interface between each display device and a mobile information terminal.
